SARKAR, ASOK K

ART UNIT	PAPER NUMBER
----------	--------------

2829

DATE MAILED: 07/17/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application N .	Applicant(s)
	09/556,795	HATA ET AL.
	Examiner	Art Unit
	Asok K. Sarkar	2829

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) Responsive to communication(s) filed on _____.
 2a) This action is FINAL. 2b) This action is non-final.
 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) Claim(s) 3-22 is/are pending in the application.
 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
 5) Claim(s) ____ is/are allowed.
 6) Claim(s) 3-22 is/are rejected.
 7) Claim(s) ____ is/are objected to.
 8) Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

9) The specification is objected to by the Examiner.
 10) The drawing(s) filed on ____ is/are: a) accepted or b) objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 11) The proposed drawing correction filed on ____ is: a) approved b) disapproved by the Examiner.
 If approved, corrected drawings are required in reply to this Office action.
 12) The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
 a) All b) Some * c) None of:
 1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
 * See the attached detailed Office action for a list of the certified copies not received.

14) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
 a) The translation of the foreign language provisional application has been received.

15) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

1) <input checked="" type="checkbox"/> Notice of References Cited (PTO-892)	4) <input type="checkbox"/> Interview Summary (PTO-413) Paper No(s). _____
2) <input type="checkbox"/> Notice of Draftsperson's Patent Drawing Review (PTO-948)	5) <input type="checkbox"/> Notice of Informal Patent Application (PTO-152)
3) <input type="checkbox"/> Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____	6) <input type="checkbox"/> Other: _____

DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 3 – 22 have been considered but are moot in view of the new ground(s) of rejection.

Claim Objections

2. Claim 3 is objected to because of the following informalities: The limitation “ ... viscous flow within the range of $10^{11} - 10^{13}$ Pa.S when heated at a temperature within a supercooled liquid phase region;” is incorrect because the supercooled phase region is any region between the melting point and the solidification point and will therefore have a wider viscosity range. Appropriate correction is required.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 3 – 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Saotome, “Suparplastic Micro-forming of Microstructures”, Proceedings, IEEE Workshop on Micro Electro Mechanical Systems, p 343 – 348,1994 in view of Johnson, US 5,950,705.

Regarding claim 3, Saotome discloses a method for producing a thin film-structure by the following steps:

- forming on a semiconductor die substrate a layer of an amorphous alloy material in columns 1 and 2 (see Fig.11);
- heating (forging) the layer of glass to a temperature within the supercooled liquid phase region and thereby deforming the layer to a given shape, and
- cooling the alloy to room temperature from the deformation temperature to stop deformation and form the structure in Fig. 11.

Saotome fails to expressly disclose the layer as a thin film, and exhibiting a viscous flow between $10^{11} - 10^{13}$ Pa.S when heated at a temperature within the supercooled liquid phase region, heating the thin film to a temperature within the supercooled liquid phase region so that the film has a viscous flow between $10^{11} - 10^{13}$ Pa.S and deforming the thin film to a given shape without the use of any external force.

However, Saotome's article in their results part in page 348 clearly points out that amorphous alloys in a supercooled liquid state can be used for micromechanical components/structures due to deformation under viscous flow.

The V-grove die is the substrate (Si) and the specimen on top is the amorphous thin film in Saotome's Fig. 1 in page 343. The dimension of the die throat and comparing it with the thickness of the specimen in Fig. 1 establishes that the amorphous specimen is a thin film. The deformation of a material without any external force is inherent under viscous flow deformation. Saotome is using the press for the deformation only to develop some theoretical deformation curves such as Fig. 9. A simple calculation and extrapolation of curves to very low tensile stress (such as stress due to the weight of the film without the use of any external pressure) would show that

the viscous flow in Pa.S unit (viscosity within the supercooled phase region) to be within the $10^{11} - 10^{13}$ Pa.S range.

Additionally, Johnson teaches that the equilibrium viscosity of amorphous materials is above 10^{13} Pa.S above the glass transition temperature and is solid for all practical purpose in column 4, lines 9 - 14.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to form a thin film of the amorphous/glassy alloy material in stead of the layer, which will inherently exhibit a viscous flow between $10^{11} - 10^{13}$ Pa.S when heated at a temperature within the supercooled liquid phase region and at the glass transition temperature as taught by Johnson and heat the alloy film to a temperature within the supercooled region at a viscous flow between $10^{11} - 10^{13}$ Pa.S to deform the alloy without applying any external pressure and cooling the alloy to room temperature to retain the deformed structure as taught by Saotome. Heating at a higher temperature will tend to initiate melting behavior and deform the film, whereas at lower temperature, there will be practically no deformation. These are the inherent properties of metallic glassy substances/materials as taught by Johnson.

Regarding claim 4, Saotome discloses a thin film-structure where the amorphous alloy has a glass transition temperature within 200 - 600°C in column 1, page 346.

Saotome fails to disclose the temperature width of not less than 20°C in the supercooled liquid phase region.

Barsoum teaches that many glassy materials are known to possess a glass transition temperature within 200 - 600°C and a temperature width of not less than 20°C in the supercooled liquid phase region (see Fig. 9.10 in page 316).

Therefore, it would have been obvious at the time the invention was made to one of ordinary skill in the art to employ an amorphous material of glass having a glass transition temperature within 200 - 600°C and a temperature width of not less than 20°C in the supercooled liquid phase region since Barsoum teaches that amorphous materials with a glass transition temperature within 200 - 600°C and a temperature width of not less than 20°C in the supercooled liquid phase region is well known.

Regarding claim 5, deformation of the thin film of glass by its own weight is inherent in the disclosed method of Saotome.

5. Claims 6, 7 and 9 – 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Saotome, "Suparplastic Micro-forming of Microstructures", Proceedings, IEEE Workshop on Micro Electro Mechanical Systems, p 343 – 348, 1994 1994 in view of Johnson, US 5,950,705 as applied to claim 3 above, and further in view of Aksyuk, US 5,994,159.

Regarding claim 6, Saotome in view of Johnson fails to teach deformation of thin film in the thin film structure by mechanical external force.

Aksyuk teaches a method of fabricating a thin film structure for micro-mechanical device in which the thin film beam 8 (see Fig. 1) is deformed by external mechanical force in column 6, line 22.

Art Unit: 2829

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Saotome by mechanical external force to form the thin film structure as taught by Aksyuk.

Regarding claim 7, Saotome in view of Johnson fails to teach deformation of thin film in the thin film structure by electrostatic external force.

Aksyuk teaches a method of fabricating a thin film structure for micro-mechanical device in which the thin film beam 8 (see Fig. 1) is deformed by external electrostatic force in column 5, line 62.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Werner by electrostatic external force to form the thin film structure as taught by Aksyuk.

Regarding claim 9, Saotome in view of Johnson fails to teach deformation of thin film in the thin film structure by electrostatic external force.

Aksyuk teaches a method of fabricating a thin film structure for micro-mechanical device in which the thin film beam 8 (see Fig. 1) is deformed by external electrostatic force wherein an electrode layer made of conductive material is formed nearby the thin film, an opposite electrode being formed opposing the thin film and the thin film is deformed by the electrostatic external forces generated between the electrode layer and the opposite electrode in between column 5, line 61 and column 6, line 13.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Saotome by electrostatic external force to form the thin film structure wherein an electrode layer made of conductive material is

Art Unit: 2829

formed nearby the thin film, an opposite electrode being formed opposing the thin film and the thin film is deformed by the electrostatic external forces generated between the electrode layer and the opposite electrode as taught by Aksyuk.

Regarding claim 10, Saotome in view of Johnson fails to teach deformation of thin film in the thin film structure by magnetic external force.

Aksyuk teaches a method of fabricating a thin film structure for micro-mechanical device in which the thin film beam 8 (see Fig. 1) is deformed by external magnetic force in column 6, line 15.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Saotome by magnetic external force to form the thin film structure as taught by Aksyuk.

Regarding claim 11, Saotome in view of Johnson fails to teach deformation of thin film in the thin film structure by magnetic external force.

Aksyuk teaches a method of fabricating a thin film structure for micro-mechanical device in which the thin film beam 8 (see Fig. 1) is deformed by external electrostatic force wherein a magnetic layer made of a magnetic material is formed nearby the thin film, an opposite magnet being formed opposing the thin film and the thin film is deformed by the magnetic external forces generated between the magnetic layer and the opposite magnet in column 6, lines 14 - 20.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Saotome by applying magnetic external force to form the thin film structure wherein a magnetic layer made of a magnetic

Art Unit: 2829

material is formed nearby the thin film, an opposite electrode being formed opposing the thin film and the thin film is deformed by the magnetic external forces generated between the magnetic layer and the opposite magnet as taught by Aksyuk.

Regarding claims 12 – 14, Saotome in view of Johnson teaches deforming the thin film amorphous material by heating as described earlier with respect to claims 3 and 5.

Saotome in view of Johnson fails to teach deforming the thin film by magnetic forces where the thin film is heated in the Curie Temperature range of the magnetic material such as Ni, Fe, Co and Mn, the Curie Temperature being in the range of 210 – 1200°C.

Aksyuk teaches deforming the thin film by magnetic forces generated by induced current but fails to expressly teach that the magnetic force can be generated by using magnetic materials such as Ni, Fe, Co and Mn having the Curie Temperature in the range of 210 – 1200°C.

However, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Saotome by heating it within supercooled liquid region and applying magnetic external force to form the thin film structure wherein a magnetic layer is made of a common magnetic materials such as Ni, Fe, Co and Mn having the Curie Temperature in the range of 210 – 1200°C in stead of an electromagnet.

Art Unit: 2829

Regarding claims 15 – 18, Saotome in view of Johnson teaches deforming the thin film amorphous material by heating as described earlier with respect to claims 3 and 5.

Regarding claim 15, Saotome in view of Johnson fails to teach to form a subsidiary layer made of a material having a different thermal expansion coefficient from that of the amorphous material nearby the film and the thin film is deformed by the stress resulting from the difference in thermal expansion coefficient between the thin film and the subsidiary layer generated in their interface. Saotome in view of Johnson also fails to teach the magnitude of the thermal expansion coefficient, the thickness of the subsidiary layer and the make up of the subsidiary layer.

Aksyuk teaches a method of producing a thin film-structure where the beam is made up of two layers with one layer being polysilicon of a thickness of 1.5 micron and each layer having different linear thermal expansion and the deformation of the thin film is actuated by generating stress due to differential contraction of the two layers which is the result of different linear thermal expansion.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film modifying Saotome's method by using a subsidiary layer made of material having different linear thermal expansion than that of the amorphous thin film material and by simultaneous application of heat as taught by Aksyuk.

Regarding claims 16 – 18, Aksyuk teaches the thickness of the subsidiary layer in column 5, line 11 but fails to teach the magnitude of the thermal expansion

coefficient, and the make up of the subsidiary layer except that it is polysilicon in column 5, line 10.

However, it would have been obvious to one with ordinary skill in the art at the time of the invention to judiciously adjust and control parameters of the subsidiary layer such as thermal expansion coefficient, which also depends on the composition and the relative thickness of this layer with respect to the thin film during the deformation of an amorphous glassy thin film structure by the generation of stress due to thermal expansion mismatch through routine experimentation and optimization to achieve optimum benefits (see MPEP 2144.05) and it would not yield any unexpected results. Since the deformation is also induced by heat, it would be logical to combine the substrate material with the thin film material to provide an efficient deformation mechanism by the thermal expansion mismatch technique.

Regarding claims 19 – 22, Saotome in view of Johnson teaches deforming the thin film amorphous material by heating as described earlier with respect to claims 3 and 5.

Regarding claim 19, Saotome in view of Johnson fails to teach to form a subsidiary layer including an internal stress is formed nearby the film and the thin film is deformed by the stress resulting from the difference in internal stress between the thin film and the subsidiary layer generated in their interface. Saotome also fails to teach the magnitude of the compressive or tensile stress, the thickness of the subsidiary layer and the make up of the subsidiary layer.

Aksyuk teaches a method of producing a thin film-structure where the beam is made up of two layers with one layer being polysilicon of a thickness of 1.5 micron and each layer having high intrinsic strain and the deformation of the thin film is actuated due to internal stresses of the two in column 5, lines 19 - 33.

Regarding claims 20 – 22, Aksyuk fails to expressly disclose the magnitude of the stress in the subsidiary layer, the relative thickness with respect to the thin film and the composition of the subsidiary layer made by mixing the substrate and the amorphous thin film.

However, it would have been obvious to one with ordinary skill in the art at the time of the invention to judiciously adjust and control parameters of the subsidiary layer such as the magnitude of the internal intrinsic stress which also depends on the composition and the relative thickness with respect to the thin film during the deformation of an amorphous glassy thin film structure by the generation of stress due to the difference in internal stress between them through routine experimentation and optimization to achieve optimum benefits (see MPEP 2144.05) and it would not yield any unexpected results. Since the deformation is also induced by heat, it would be logical to combine the substrate material with the thin film material to provide an efficient deformation mechanism by the internal stress differences between the two materials.

6. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Saotome, "Suparplastic Micro-forming of Microstructures", Proceedings, IEEE Workshop on Micro Electro Mechanical Systems, p 343 – 348,1994 in view of Johnson, US 5,950,705 and

Art Unit: 2829

Aksyuk, US 5,994,159 as applied to claim 7 above, and further in view of Tregilgas, EP 0,762,176 A2

Saotome in view of Johnson fails to teach deformation of thin film in the thin film structure by electrostatic external force.

Aksyuk teaches a method of fabricating a thin film structure for micro-mechanical device in which the thin film beam 8 (see Fig. 1) is deformed by external electrostatic force wherein an electrode layer made of conductive material is formed nearby the thin film, an opposite electrode being formed opposing the thin film and the thin film is deformed by the electrostatic external forces generated between the electrode layer and the opposite electrode in between column 5, line 61 and column 6, line 13.

Aksyuk fails to teach that the thin film is made of a conductive material.

Tregilgas teaches a method of producing a thin film structure where they teach forming a beam 24 (see Fig. 3f) of an amorphous conductive material (nitrided aluminum or non-aluminum alloy) in column 1, lines 49 – 53.

Therefore, it would have been obvious to one with ordinary skill in the art at the time of the invention to deform the thin film of Saotome by electrostatic external force to form the thin film structure as taught by Aksyuk wherein the thin film is made of conductive material as taught by Tregilgas and the thin film is deformed by the external electrostatic force generated between the thin film and the opposite electrode to form the thin film structure.

Conclusion

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Asok K. Sarkar whose telephone number is 703 308 2521. The examiner can normally be reached on Monday - Friday (8 AM- 5 PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kammie Cuneo can be reached on 703 308 1233. The fax phone numbers for the organization where this application or proceeding is assigned are 703 308 7722 for regular communications and 703 308 7722 for After Final communications.

Art Unit: 2829

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703 308 4918.
